

## **Binary Code Upgrades and Migrates Claims Management Systems**

### **Overview**

Migrate the existing claims management system to a new user friendly and web based system

### **The client**

Client is a Managed Care Organization, managing workman's injury compensation on behalf of employers.

### **The business need**

Client needed to upgrade their existing claims management application from an archaic AS400-based legacy system to a user-friendly web-based solution.

### **Key challenges**

Non-compliance was also an issue since expired data had not been retired in accordance with corporate data retention policies. This was made more compelling by the Sarbanes Oxley Act.

### **The Binary Code solution**

A team of analysts, developers, testers and managers from Binary Code worked in conjunction with the client users team, delivering successfully the stated requirements in just under nine calendar months. The solution was crafted as a pure .Net application using C#, ASP.NET, SQL Server 2000, Windows Services, Web Services, Windows 2000 and deployed on IIS 5.0.

### **Value delivered**

- The new system has several additional features such as a check printing, extensive reporting
- Complete migration and upgrade performed in less than 9 months
- A custom EDI tool was added – which handles the generation and parsing of various EDI documents
